Module Leader

Prof FA McRobie [1]

Lecturers

Prof FA McRobie, Dr JP Talbot, Dr SK Haigh [2]

Lab Leader

Prof FA McRobie [1]

Timing and Structure

Lent term. 12 lectures + coursework. Assessment: 75% exam/25% coursework

Prerequisites

3D7, 3D2 and 3D4 useful

Aims

The aims of the course are to:

- introduce the behaviour and design of civil engineering structures subjected to time-varying loads.
- introduce earthquake-resistant design, dynamic soil-structure interaction, machine foundation design, blast effects on structures and the fundamentals of wind engineering.

Objectives

As specific objectives, by the end of the course students should be able to:

- identify cases where a static model of a structure is inadequate, and a dynamic model should be used
- produce a simple estimate of the natural frequency and fundamental natural mode of any linear-elastic structure.
- estimate linear-elastic spring parameters for a given foundation.
- compute the natural frequencies and natural modes of structures using the ABAQUS package and include simple soil models to account for soil-structure interaction.
- estimate the response of complex linear-elastic structures to earthquakes using modal superposition and the response spectrum.
- use elastic and inelastic design spectra, and to understand their form.
- perform simple designs for vibration isolation.
- perform simplified soil stiffness calculations accounting for partial liquefaction, and to use this approach in simple liquefaction resistant designs.
- describe some standard methods of seismic-resistant structural design.
- describe blast processes and their effects on structures.
- appreciate the factors involved in the estimation of wind climates and of structural response to wind.
understand the various measures that characterise atmospheric turbulence.
- anticipate the circumstances under which aeroelastic phenomena may be problematic.
- estimate the dynamic response of a tall structure in a given wind environment

Content

LECTURE SYLLABUS

**Structural dynamics** (3L, Dr James Talbot)

- *Linear Elastic dynamics*
- Introduction to dynamic loads in Civil Engineering; dynamic amplification factors.
- Approximate single-degree-of-freedom analysis of complex structures; sway frames; structures with distributed mass.
- Rayleigh's principle; natural frequency of simple systems using energy methods.
- Linear models to represent structures and their relevance; analysis in frequency domain; mode superposition method.
- Modal analysis of vibration; use of finite element packages.

**Application of dynamics in Civil Engineering Structures:**

**Soil-Structure Interaction** (3L, Dr S.K Haigh)

- *Non-linear Systems*
- Sources of nonlinearity in structures and foundations
- *Soils during earthquakes*
  - Earthquake loading on structures; response and design spectra;
  - Structures subject to ground motion; deformations due to lateral accelerations; Newmark's sliding block analysis; concept of threshold acceleration
  - Foundations effects; stiffness of soil foundation and soil-structure interaction;
  - Pore pressure build-up during earthquakes; partial liquefaction; degradation in soil stiffness; non-linear soil models.
  - Liquefaction resistant design, simple examples.

**Earthquakes Effects on Structures and Seismic resistant design** (3L, Prof F.A. McRobie)

- *Response Spectrum Analysis for Earthquakes*
  - Introduction to Response Spectrum Analysis
  - Earthquake Spectra and Design Spectra, Design of linear systems
á Non-linear Response Spectrum Analysis, Ductility in Structures

*Seismic Resistant Design*
á Structural design and detailing considerations.

**Wind Engineering and Blast Resistant Design** *(3L, Prof F.A. McRobie)*

*Wind loading*
á Nature of wind;
á Wind forces on structures.
á Response of structures to buffetting.

*Blast Loading*
á Physics of blasts; blast effects on structures; blast-resistant design.

**Coursework**

Seismic analysis of an existing tall building using the ABAQUS finite element package and a study of the effect of foundation softening on the overall structural response. Total time 8 hours.
