Thursday 26 April 2022 2 to 3.40

---

**Module 3C8**

**MACHINE DESIGN**

*Answer not more than **three** questions.*

*All questions carry the same number of marks.*

*The **approximate** percentage of marks allocated to each part of a question is indicated in the right margin.*

*Write your candidate number **not** your name on the cover sheet.*

**STATIONERY REQUIREMENTS**

Single-sided script paper

**SPECIAL REQUIREMENTS TO BE SUPPLIED FOR THIS EXAM**

CUED approved calculator allowed

Attachment: Module 3C8 data sheet (9 pages).

Engineering Data Book

**10 minutes reading time is allowed for this paper at the start of the exam.**

**You may not start to read the questions printed on the subsequent pages of this question paper until instructed to do so.**

**You may not remove any stationery from the Examination Room.**

1 Figure 1 shows a pair of identical gears, each consisting of a central disc and 10 radial pegs. The pegs are cylinders of radius  $r$ . The length of the pegs is such that there is always one pair of pegs in contact. The distance between the centres of the two gears is  $R$ . For the purposes of calculating the contact geometry and kinematics, it can be assumed that  $r$  is negligibly small compared with  $R$ . The axes  $A_1$  and  $A_2$  about which Gears 1 and 2, respectively, rotate are perpendicular to each other, and both lie in the horizontal plane. The angle between the centre-line of the peg on Gear 1 (labelled C-L) and the horizontal is  $\theta$ . A constant torque  $T$  is applied to Gear 1, which rotates at a constant angular velocity  $\dot{\theta}$ . Rotation of Gear 1 is clockwise, so that  $\dot{\theta}$  is negative. Unit vectors  $i, j$  and  $k$  define an orthogonal coordinate system as shown on the figure.

- (a) Assuming Hertzian contact theory can be applied to the contact between the pegs, derive an expression for the Hertz stress at the contact in terms of  $\theta, r, R, T$ , and the Young's modulus  $E$  and Poisson's ratio  $\nu$  of the pegs. Describe also how the contact pressure varies across the contact patch. [15%]
- (b) Find an expression, as a function of  $\theta$ , for the angle between the contact normal of the pegs and the vertical direction. [20%]
- (c) Find expressions for:
- the sliding velocity at the centre of the contact patch; [35%]
  - the spin velocity at the contact. [20%]
- (d) Comment on the variation with angular position  $\theta$  of the power lost due to friction. [10%]

Fig. 1

2 Figure 2 shows a cross-section through part of a compound gearbox used in an automatic transmission. Two input shafts A and B rotate at speeds  $\omega_A$  and  $\omega_B$ , respectively, while the output shaft D rotates at  $\omega_D$ . Element C rotates at angular speed  $\omega_C$  about the same axis as shafts A, B and D, and carries with it planetary gear elements E which are free to rotate relative to C. The different elements are connected via bevel gears, with tooth numbers  $a, b, d, e_1$  and  $e_2$ , as marked on Fig. 2 at the relevant meshing points. Because of the geometry of the gears, note that  $a = b$ .

(a) Element C is held fixed (i.e.  $\omega_C = 0$ ). Derive expressions for the angular speeds  $\omega_B$  and  $\omega_D$ , in terms of  $\omega_A$  and the tooth numbers  $a, d, e_1$  and  $e_2$ . [25%]

(b) Element C is now released. Show that the angular speeds of the three shafts A, B and D can be related by a linear equation of the form

$$\omega_D = \alpha\omega_A + \beta\omega_B$$

finding expressions for  $\alpha$  and  $\beta$  in terms of the tooth numbers  $a, d, e_1$  and  $e_2$ . [45%]

(c) With element C released and with  $\omega_A = 2\omega_B$ , find an expression, in terms  $\alpha$  and  $\beta$ , for the power input through shaft A as a proportion of the output power through shaft D. [30%]

Fig. 2

3 A car has mass  $m = 1500$  kg, rolling resistance coefficient  $C_r = 0.02$ , frontal area  $A = 2.0$  m<sup>2</sup>, aerodynamic drag coefficient  $C_d = 0.3$ , and wheel radius  $R = 0.35$  m. The force  $F$  resisting forward motion at constant speed  $V$  on horizontal ground is:

$$F = mgC_r + \frac{1}{2}\rho AC_d V^2$$

where  $g$  is the gravitational force per unit mass and air density  $\rho = 1.2$  kg m<sup>-3</sup>. The vehicle is driven by an electric motor with the output characteristic shown in Fig. 3, where rpm means revolutions per minute. The permitted operating region is indicated by the shaded region.

- (a) The electric motor drives the wheels of the vehicle through a single fixed speed ratio.
- (i) Calculate the maximum possible speed of the vehicle on horizontal ground and the corresponding speed ratio (motor speed : wheel speed). [25%]
- (ii) For the speed ratio found in (a)(i), use numerical integration of data presented on a plot with axes  $V$  and  $F$ , or otherwise, to calculate an approximate value for the minimum time taken to accelerate the car from rest to 80% of the maximum speed. [35%]
- (b) It is decided to equip the vehicle with a gearbox to include a second speed ratio, to reduce the time calculated in (a)(ii). The vehicle initially accelerates from rest in the new ratio. The speed ratio is then changed to the ratio found in (a)(i) before the vehicle reaches maximum speed.
- (i) Choose a suitable new ratio, explaining your reasoning using qualitative arguments and stating any assumptions made. [20%]
- (ii) Calculate an approximate value for the new minimum time taken to accelerate from rest to 80% of the maximum vehicle speed, and state the vehicle speed at which the ratio should be changed. [20%]

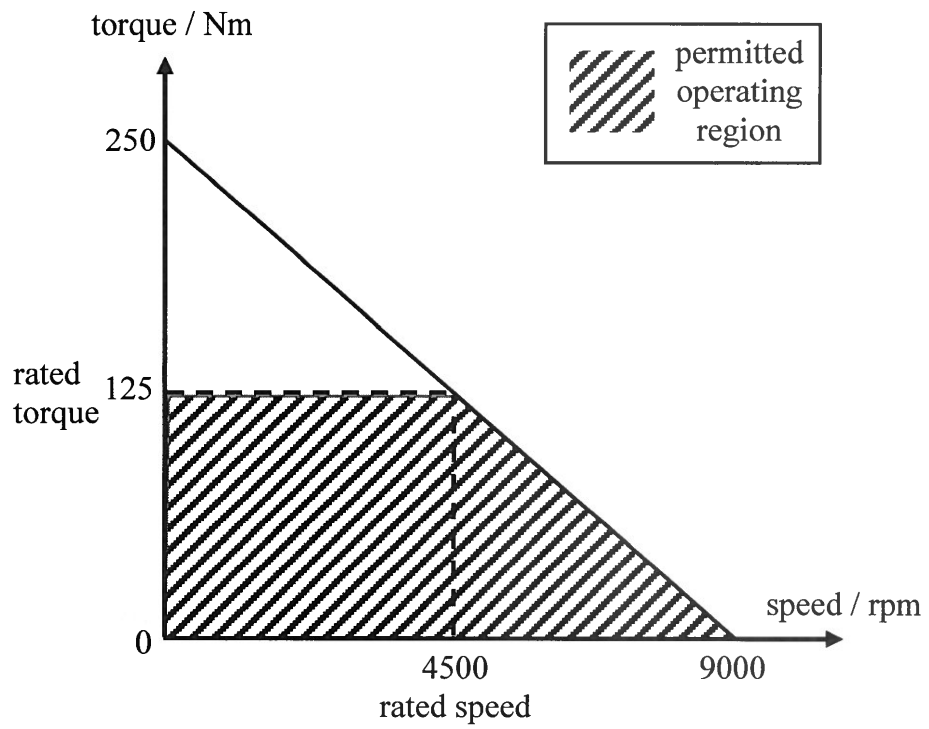

Fig. 3

4 (a) A torque  $T$  causes surface failure of two accurately-made spur gears, both with 38 involute teeth. The gears have module  $m$ , pressure angle  $\phi = 20^\circ$ , and addendum  $a = 1.2m$ , which gives a contact ratio of 2. Assuming the same failure mechanism, find the expected safe pinion torque, in terms of  $T$ , when one of the spur gears meshes with a rack with standard teeth having a pressure angle  $\phi = 20^\circ$  and an addendum  $a = m$ . [50%]

(b) A pair of identical spur gears, with standard pressure angle  $\phi = 20^\circ$ , is required to transmit power of 50 kW at a shaft speed of 2,000 revolutions per minute for a duration of 100 hours with 90% reliability. Each gear wheel is supported by a single deep groove ball bearing of outer diameter  $D$ . The bearings are well lubricated such that the factor  $a_{23} = 1$ . The gears are required to have the smallest possible distance  $a$  between centres subject to  $a \geq 1.1D$ .

(i) Show that a suitable bearing minimises  $D$ , subject to exceeding a minimum value of  $CD$ , where  $C$  is the basic dynamic load rating of the bearing. [30%]

(ii) Find the minimum allowable value of  $CD$  and hence select, from the deep groove ball bearings in the data sheet, the bearing that minimises  $a$  subject to  $a \geq 1.1D$ . [20%]

**END OF PAPER**

# ENGINEERING TRIPOS Part IIA

## Module 3C8 Data Sheet

### ELASTIC CONTACT STRESS FORMULAE

Suffixes 1, 2 refer to the two bodies in contact.

$$\text{Effective curvature } \frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2}$$

$$\text{Contact modulus } \frac{1}{E^*} = \frac{1-\nu_1^2}{E_1} + \frac{1-\nu_2^2}{E_2}$$

where  $R_1, R_2$  are the radii of curvature of the two bodies (convex positive).

where  $E_1, E_2$  and  $\nu_1, \nu_2$  are Young's moduli and Poisson's ratios

	<u>Line contact</u> width $2b$ ; load $P'$ per unit length	<u>Circular contact</u> diameter $2a$ ; load $P$
Semi contact width or contact radius	$b = 2 \left\{ \frac{P'R}{\pi E^*} \right\}^{1/2}$	$a = \left\{ \frac{3PR}{4E^*} \right\}^{1/3}$
Maximum contact pressure ('Hertz stress')	$p_0 = \left\{ \frac{P'E^*}{\pi R} \right\}^{1/2}$	$p_0 = \frac{1}{\pi} \left\{ \frac{6PE^{*2}}{R^2} \right\}^{1/3}$
Approach of centres	$\delta = \frac{2P'}{\pi} \left[ \frac{1-\nu_1^2}{E_1} \left\{ \ln \left( \frac{4R_1}{b} \right) - \frac{1}{2} \right\} + \frac{1-\nu_2^2}{E_2} \left\{ \ln \left( \frac{4R_2}{b} \right) - \frac{1}{2} \right\} \right]$	$\delta = \frac{a^2}{R} = \frac{1}{2} \left\{ \frac{9}{2} \frac{P^2}{E^{*2} R} \right\}^{1/3}$
Mean contact pressure	$\bar{p} = \frac{P'}{2b} = \frac{\pi}{4} p_0$	$\bar{p} = \frac{P}{\pi a^2} = \frac{2}{3} p_0$
	$\tau_{\max} = 0.300 p_0$ at $x = 0, z = 0.79b$	$\tau_{\max} = 0.310 p_0$ at $r = 0, z = 0.48a$ for $\nu = 0.3$
Maximum tensile stress	zero	$\frac{1}{3}(1-2\nu)p_0$ at $r = a, z = 0$

#### Mildly elliptical contacts

If the gap at zero load is  $h = \frac{1}{2}Ax^2 + \frac{1}{2}By^2$  and  $0.2 < A/B < 5$  then

ratio of semi-axes  $b/a \cong (A/B)^{2/3}$

To calculate the contact area or Hertz stress use the circular contact equations with  $R = (AB)^{-1/2}$  or better  $R_e = [AB(A+B)/2]^{-1/3}$ .

For approach use circular contact equation with  $R = (AB)^{-1/2}$  (not  $R_e$ )

Hertzian contact frictional losses

**INVOLUTE GEARING**

Spur gears

pitch cylinder radii	$r$	} with suffix 1 or 2	circumferential pitch	$p = 2\pi r/N$
base cylinder radii	$r_b$		base pitch	$p_b = p \cos \phi$
addendum cylinder radii	$r_a$		module	$m = p/\pi = 2r/N$
number of teeth	$N$		ratio of contact	$r_c$
addendum	$a = r_a - r$		radius of curvature at pitch point	$\rho = r \sin \phi$
pressure angle	$\phi$			

Path of contact

$$l = \left\{ r^2 \sin^2 \phi + a(2r+a) \right\}^{1/2} - r \sin \phi$$

For a standard  $20^\circ$  spur wheel with  $N$  teeth of module  $m$  this becomes

$$\frac{l}{m} = \left( 0.02924N^2 + N + 1 \right)^{1/2} - 0.1710N$$

### Standard tooth forms

Addendum  $a = m$ , Dedendum  $= \frac{7}{6}m$ , pressure angle  $= 20^\circ$ .

Modules:	0.3 – 1.0 mm in 0.1 mm steps
1.0 – 4.0 mm in 0.25 mm steps	4.0 – 7.0 mm in 0.5 mm steps
7.0 – 16.0 mm in 1.0 mm steps	16.0 – 24.0 mm in 2.0 mm steps
24.0 – 45.0 mm in 3.0 mm steps	45.0 – 75.0 mm in 5.0 mm steps

### Friction in spur gears

$$\frac{\text{average friction loss}}{\text{power transmitted}} \approx \mu\pi \left\{ \frac{1}{N_1} + \frac{1}{N_2} \right\}$$

### Tooth failure

Allowable bending stress  $\sigma_b$  according to AGMA guidelines given by  $\sigma_b = \frac{P_T'}{Jm}$

where  $P_T'$  is force per unit face-width acting tangentially to pitch circle and  $J$  given in the figure below for  $20^\circ$  spur gears. Typical values of  $\sigma_b$  shown in table.

Typical allowable tooth stresses (AGMA)

Material	Condition	Bending fatigue strength $\sigma_b$ (MPa)	Surface fatigue strength $\sigma_s$ (MPa)
Steel	Through hardened and tempered	170-390	590-1200
	Carburised and case hardened	380-480	1250-1550
Cast iron	As cast	69-90	450-590
Nodular iron	Quenched, annealed and tempered	150-300	500-800
Malleable iron	Pearlitic	70-145	500-650

### EPICYCLIC SPEED RULE

$$\omega_s = (1 + R)\omega_c - R\omega_a \quad \text{where } R = \frac{A}{S}$$

### ROLLING ELEMENT BEARINGS

#### Fatigue life

$$L = a_1 a_2 a_3 (C/P)^p \quad p = 3 \text{ for ball and } 10/3 \text{ for roller bearings}$$

Fatigue probability %	10	5	4	3	2	1
Life adjust factor $a_1$	1	0.62	0.53	0.44	0.33	0.21

#### Bearing choice

The information on the following pages concerning loads, viscosities and standard bearing sizes and ratings is extracted from the SKF General Bearing Catalogue and is copied with permission. It is SKF copyright and is not to be further reproduced.

**Engineering Tripos Part IIA: Module 3C8  
Machine Design**

**Numerical answers – 2022**

1. (b)  $\phi = \cos^{-1}\left(\frac{1}{\sqrt{1+2\tan^2\theta}}\right)$ , (c)(i)  $\Omega R\phi = (-\tan\theta \quad -\tan\theta \quad 0)^T$ ,

(c)(ii)  $\frac{-2\Omega\tan\theta}{\sqrt{1+2\tan^2\theta}}$  along the common normal direction

2. (a)  $-1; \frac{ae_1}{be_2}$

2. (b)  $\alpha = \frac{\left(\frac{ae_1}{be_2} + 1\right)}{2}, \beta = \left(\frac{ae_1}{be_2} - 1\right) / 2$

2 (c)  $\frac{\alpha}{\alpha + \beta/2}$

3. (a)(i) 50 m/s, 3.30 (a) (ii) 90 s approx., b(ii) 40 s approx., choosing  $G=6.6$

4. (a) 1.26 T (b) 6008
