1 An axial turbine is designed to operate with hydrogen as a working fluid. The turbine is designed as part of the hydrogen fuel system for a future hypersonic aircraft. The turbine is designed with a repeating stage and 50% reaction, a stage loading coefficient of 1.85, and a total-to-total efficiency of 91%. The following relationship applies to a repeating stage of an axial turbomachine

$$\psi = 2(1 - \Lambda - \phi \tan \alpha_1)$$

where  $\alpha_1$  is the absolute flow angle at entry to the stage,  $\phi$  is the flow coefficient,  $\psi$  is the stage loading coefficient and  $\Lambda$  is the reaction.

- (a) Considering the Smith chart shown in Fig. 1, determine the flow coefficient of the turbine. Hence calculate the flow angles for a stage of the turbine and draw the velocity triangles. [30%]
- (b) The mass flow rate of hydrogen is  $10 \text{ kg s}^{-1}$ . The stagnation pressure and stagnation temperature of the hydrogen at inlet are 50 bar and 600 K and the mean radius at inlet is 0.1 m. The turbine rotates at 20000 rpm. Calculate the blade height at stator inlet. [10%]
- (c) Calculate the Mach number at the exit of the stator. Explain why this is different from the Mach number that would occur if the working fluid of the turbine was replaced with air. [20%]
- (d) The pressure ratio of the turbine is 4. Calculate how many stages are required in the turbine. Explain why the number of stages would change if the working fluid was changed to air and the pressure ratio and inlet conditions to the turbine remain unchanged. [20%]
- (e) A designer decides to redesign the turbine to reduce the number of stages by changing the stage loading coefficient and flow coefficient. Calculate the minimum number of stages which can be achieved. Explain why there is a practical lower limit on the number of stages. [20%]

Assume hydrogen behaves as a perfect gas with  $\gamma = 1.41$  and  $c_p = 14200 \text{ J kg}^{-1} \text{ K}^{-1}$ .

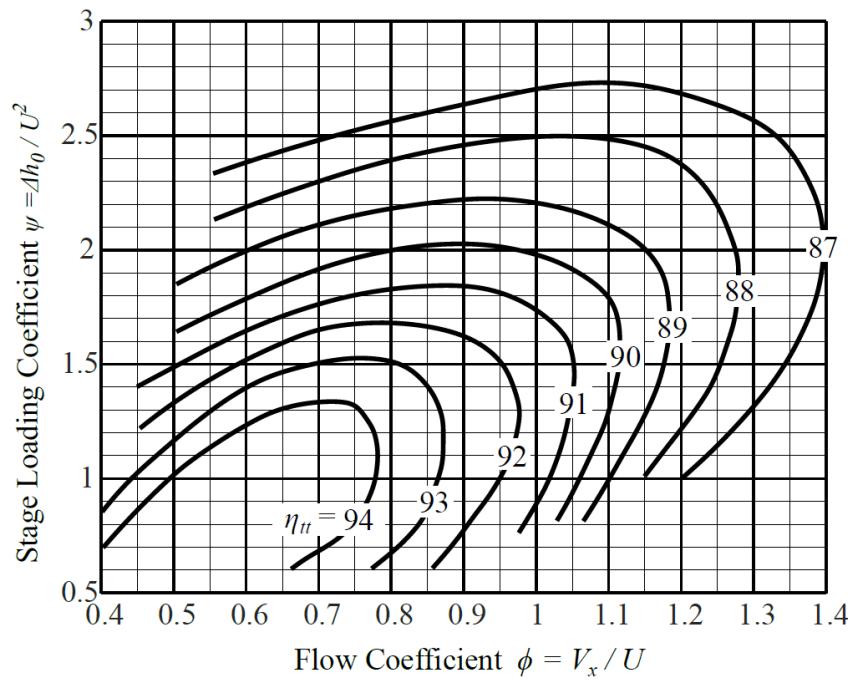

Fig. 1

2 A single shaft turbojet, shown in Fig. 2 with the station numbers 1 to 5, is used to power an aircraft.

(a) The axial compressor in the turbojet has 6 stages and has a stagnation pressure ratio of 3.80 and a stagnation temperature ratio of 1.53. Calculate the polytropic efficiency of the compressor. [10%]

(b) The turbine stator and nozzle remain choked over the entire operating range of the turbojet. The polytropic efficiency of the turbine is the same as the polytropic efficiency of the compressor, calculated in part (a). Both efficiencies remain constant as the operating point of the turbojet is changed. Show that the pressure ratio of the compressor is given by

$$\frac{P_{02}}{P_{01}} = \left( 1 - B \frac{T_{03}}{T_{01}} \left( 1 - \left( \frac{A_3}{A_5} \right)^C \right) \right)^D$$

where the compressor inlet stagnation temperature is  $T_{01}$ , the turbine inlet stagnation temperature is  $T_{03}$ , the throat area of the turbine stator is  $A_3$ , the throat area of the propulsive nozzle is  $A_5$ , and  $B$ ,  $C$  and  $D$  are constants. Determine the values of the constants. [40%]

(c) Find an expression for the compressor inlet non-dimensional mass flow function  $\dot{m}\sqrt{c_p T_{01}} / P_{01} A_1$  as a function of the non-dimensional temperature ratio  $T_{03} / T_{01}$  and the throat area ratio  $A_3 / A_5$ . [20%]

(d) On a constant speed characteristic, the compressor pressure ratio can only increase by 30% and the mass flow rate can only be reduced by 10% before stall occurs. The fuel flow rate is increased suddenly causing the compressor to move towards the stall point. During the transient the compressor remains on a constant speed line. Calculate the fractional increase in the temperature ratio  $T_{03} / T_{01}$  between the stall point and the working line. [15%]

(e) Assuming that during the transient the compressor reaches the stall point, but does not stall, describe the subsequent transient of the compressor and the operating point of the engine. [15%]

Assume that both air and combustion products behave as perfect gases. Assume that air has  $\gamma = 1.4$  and  $c_p = 1005 \text{ J kg}^{-1} \text{ K}^{-1}$  and that combustion products have  $\gamma = 1.333$  and  $c_p = 1224 \text{ J kg}^{-1} \text{ K}^{-1}$ .

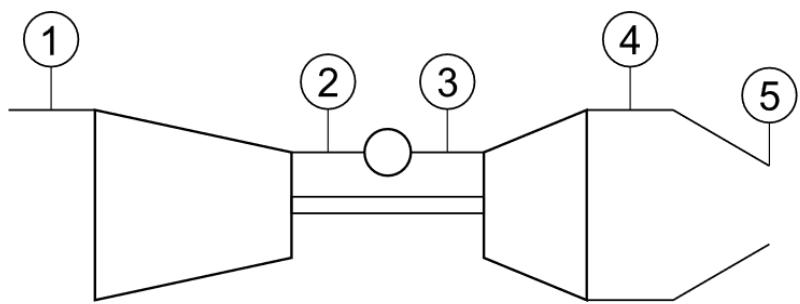

Fig. 2

3 A centrifugal compressor is designed which has radial blades at impeller exit and axial flow at compressor inlet.

- (a) Show that the loading coefficient is equal to the slip factor. Explain the causes of slip in centrifugal compressors. [20%]
- (b) The compressor is experimentally tested. The flow angle at the exit of the impeller, in the absolute frame is measured to be  $69^\circ$  and the radial velocity is 0.32 times the blade speed. Sketch the velocity triangle at this location. Calculate the slip factor. [20%]
- (c) The working fluid of the compressor is air. At the entry of the compressor the stagnation temperature and stagnation pressure are 300 K and 105 kPa. The rotational speed of the compressor is 50000 rpm. At exit the radius of the compressor is 70 mm. Calculate the stagnation temperature and the absolute Mach number at the impeller exit. [20%]
- (d) The stagnation pressure at impeller exit is measured to be 293 kPa. Calculate the total-to-total efficiency of the impeller. The axial width of the impeller at exit is 10 mm. Ignoring the thickness of the blades calculate the mass flow through the compressor. [20%]
- (e) A designer has the objective of designing an exit diffuser for the centrifugal compressor that achieves the maximum pressure recovery. Explain what they should consider in designing the individual passages of the diffuser. [20%]

Assume air behaves as a perfect gas with  $\gamma = 1.4$  and  $c_p = 1005 \text{ J kg}^{-1} \text{ K}^{-1}$ .

## Calculations

Lattice Method

Field (or wave) method

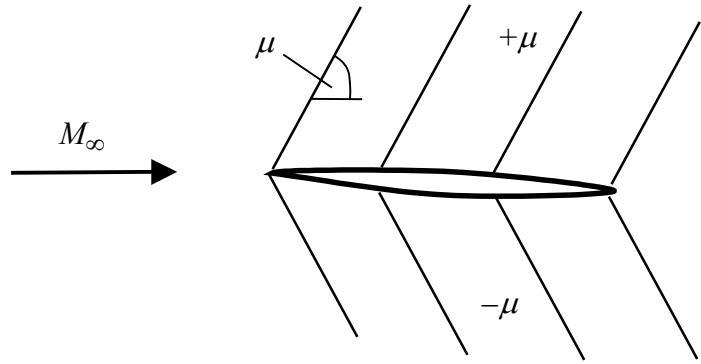

$$\nu_3 - \theta_3 = \nu_2 - \theta_2 \quad \text{along } +\mu$$

$$\nu_3 + \theta_3 = \nu_1 + \theta_1 \quad \text{across } +\mu$$

$$\nu_3 - \theta_3 = \nu_2 - \theta_2 \quad \text{across } -\mu$$

### Linearised Method of Characteristics (thin film theory)

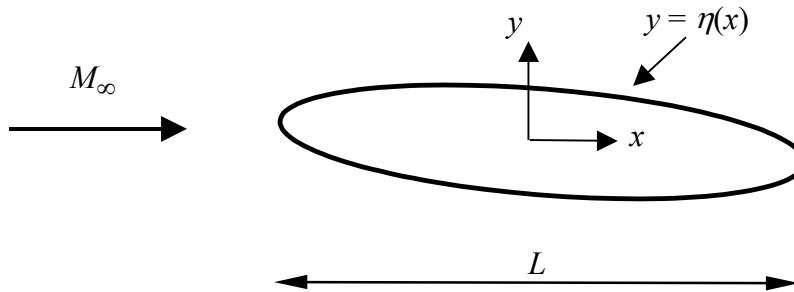

$$\mu \approx \sin^{-1}(1/M_\infty)$$

$$\Delta p \approx \pm \frac{\rho_\infty u_\infty^2 \Delta \theta}{\sqrt{M_\infty^2 - 1}} \quad \text{across } \pm \mu \text{ waves}$$
