- 1 (a) Sketch a graph showing how the exit flow angle of a turbine cascade varies with Mach number. Explain the causes of the variation. [15%]
- (b) A turbine cascade is tested using air with an inlet Mach number of 0.3 and an exit Mach number of 1.1. The inlet stagnation pressure to outlet static pressure ratio of the cascade is 2.2. Calculate the stagnation pressure loss coefficient of the cascade. [10%]
- (c) The inlet flow angle to the turbine cascade is  $-45^\circ$  and the inlet Mach number is 0.3. Assuming the blade height is constant through the cascade and that the growth of the endwall boundary layers is negligible calculate the exit flow angle from the cascade. [15%]
- (d) Two thirds of the loss occurs downstream of the throat of the blade. Calculate the opening to pitch ratio of the cascade. Calculate the deviation in exit flow angle which is caused by the loss that occurs downstream of the throat of the blade. [20%]
- (e) The exit static pressure is lowered until the limit load condition occurs. At this condition the exit flow angle of the cascade is measured to be  $54^\circ$ . Explain what is meant by the limit load of a turbine cascade. Calculate the stagnation pressure loss coefficient of the cascade at the limit load condition. [20%]
- (f) Sketch the shock structure of a turbine cascade. Explain how the loss mechanisms in the cascade change as the exit Mach number changes. [20%]

Assume air behaves as a perfect gas with  $\gamma = 1.4$  and  $c_p = 1005 \text{ J kg}^{-1} \text{ K}^{-1}$ .

2 (a) Derive the relationship

$$\psi = 2(1 - \Lambda - \phi \tan \alpha_1)$$

relating the stage loading  $\psi$ , the reaction  $\Lambda$ , the flow coefficient  $\phi$  and the interstage swirl  $\alpha_1$  of an axial flow compressor with repeating stages. [30%]

(b) A multistage compressor has a constant mean radius and is designed with a repeating stage velocity triangle. The compressor draws air from the environment. There is no inlet guide vane and so the flow enters the first rotor axially (i.e. it has  $0^\circ$  of swirl). Each stage has a loading coefficient of 0.4 and a flow coefficient of 0.6. Calculate the stage reaction, the relative and absolute flow angles, and sketch the velocity triangle. Discuss the advantages or disadvantages of designing a multistage compressor with  $0^\circ$  interstage swirl. [30%]

(c) The stagnation temperature at the inlet of the compressor in Part (b) is 300 K. The blade speed is  $250 \text{ m s}^{-1}$ . Calculate the relative Mach number at the inlet and exit of the first rotor of the compressor. [15%]

(d) The rotor has a stagnation pressure loss coefficient of 6%. Calculate the percentage reduction in blade height from inlet to exit of the rotor. [15%]

(e) The whole multistage compressor has an overall stagnation pressure ratio of 5 and an isentropic efficiency of 90%. Calculate the number of compressor stages that are required. [10%]

Assume air behaves as a perfect gas with  $\gamma = 1.4$  and  $c_p = 1005 \text{ J kg}^{-1} \text{ K}^{-1}$ .

3 A high bypass ratio turbofan engine is driven by a low pressure turbine (LPT) through a low speed spool. The bypass ratio (*BPR*) is defined as the ratio of bypass mass flow rate to that passing through the core:  $BPR = \dot{m}_b / \dot{m}_c$ . The total mass flow rate through the fan  $\dot{m}_f = \dot{m}_b + \dot{m}_c$ . The station numbers are indicated in Fig. 1.

- (a) When the turbofan engine is at its design point the stator guide vane of the first stage of the LPT and the core exhaust nozzle are choked. Show that the specific work of the fan can be expressed as

$$\dot{w}_f = C_1 T_{045}$$

where  $T_{045}$  is the LPT inlet stagnation temperature. Find coefficient  $C_1$  in terms of the exhaust gas properties  $c_{pe}$  and  $\gamma_e$ , area ratio  $A_5 / A_{45}$ , polytropic efficiency of the LPT and the *BPR*. State carefully any additional assumptions required. Over the past few decades, the bypass ratio of new turbofan engines has risen. Discuss the implications of this for the relationship between the specific work of the fan and the inlet stagnation temperature of the LPT. [30%]

- (b) The high bypass ratio turbofan engine is operated at its design point on a static engine test bed. At its design point the fan has a stagnation pressure ratio  $p_{02} / p_{01} = 1.35$ , and a polytropic efficiency,  $\eta_{pf}$ , of 0.95. The inlet stagnation temperature,  $T_{01}$ , is 288 K and the inlet stagnation pressure,  $p_{01}$ , is 101330 Pa. Assume air behaves as a perfect gas with  $\gamma = 1.4$  and  $c_p = 1005 \text{ J kg}^{-1} \text{ K}^{-1}$ .

- (i) The turbofan is operated at its design point. The area ratio  $A_1 / A_{19} = 1.2776$  and the Mach number at the fan inlet plane,  $M_1$ , is 0.80. Calculate the Mach number at the exit of the bypass nozzle and the fan bypass ratio *BPR*. [25%]

- (ii) The area  $A_1 = 1.5 \text{ m}^2$ . Calculate the mass flow rate through the fan, and the total power transmitted through the low speed spool. [20%]

- (iii) The turbofan engine is flown at a cruise altitude of 12 km and a flight Mach number of 0.8. The Mach number at the fan inlet plane,  $M_1$ , is 0.80 and the non-dimensional operating point of the fan is the same as it was in the static engine test. Calculate the bypass nozzle exit Mach number  $M_{19}$ . Comment on whether the stability margin of the fan in flight will be different from in the test. [25%]

## Calculations

Lattice Method

Field (or wave) method

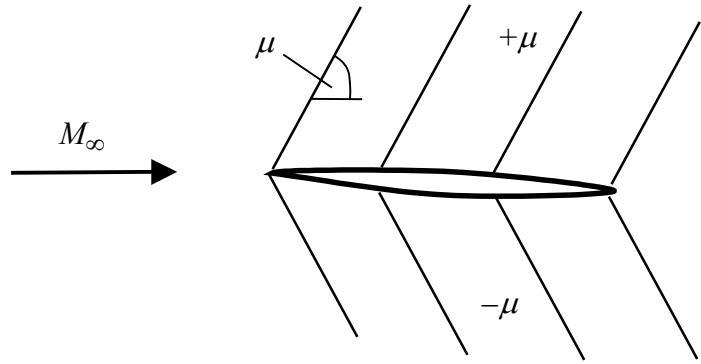

$$\nu_3 - \theta_3 = \nu_2 - \theta_2 \quad \text{along } +\mu$$

$$\nu_3 + \theta_3 = \nu_1 + \theta_1 \quad \text{across } +\mu$$

$$\nu_3 - \theta_3 = \nu_2 - \theta_2 \quad \text{across } -\mu$$

### Linearised Method of Characteristics (thin film theory)
