

ENGINEERING TRIPOS PART IIB

Tuesday 4 May 2004 9 to 10.30

Module 4M6

MATERIALS AND PROCESSES FOR MICROSYSTEMS (MEMS)

Answer not more than three questions.

All questions carry the same number of marks.

*The **approximate** percentage of marks allocated to each question is indicated in the right margin.*

Attachments: 4M6 Data Book (13 pages).

You may not start to read the questions printed on the subsequent pages of this question paper until instructed that you may do so by the Invigilator

(TURN OVER

1 (a) Starting from the raw material of quartzite, describe two methods by which bulk crystalline silicon ingots can be produced with the aid of diagrams where appropriate. [50%]

(b) (i) Ion implantation is to be used to create a boron doped layer below the surface of an intrinsic {100} oriented silicon wafer to act as a dopant selective etch stop. Using the data in Figs. 1 and 2, calculate the ion energy and dose required to produce a layer which will have an etch rate of 1% of intrinsic silicon at a depth of 1 μm below the surface of the wafer. A 10% aqueous KOH etch will be used. [25%]

(ii) Estimate the error in the etch depth if this etch stop layer is to be used in practice, stating any assumptions made. [15%]

(iii) Grooves of width 2 μm are to be etched deep into the bulk of the semiconductor by protecting regions of the silicon wafer from the implanted ion dose using a hard mask material, as shown in Fig. 3. Estimate the lateral dimension of the hard mask required, stating any assumptions made. [10%]

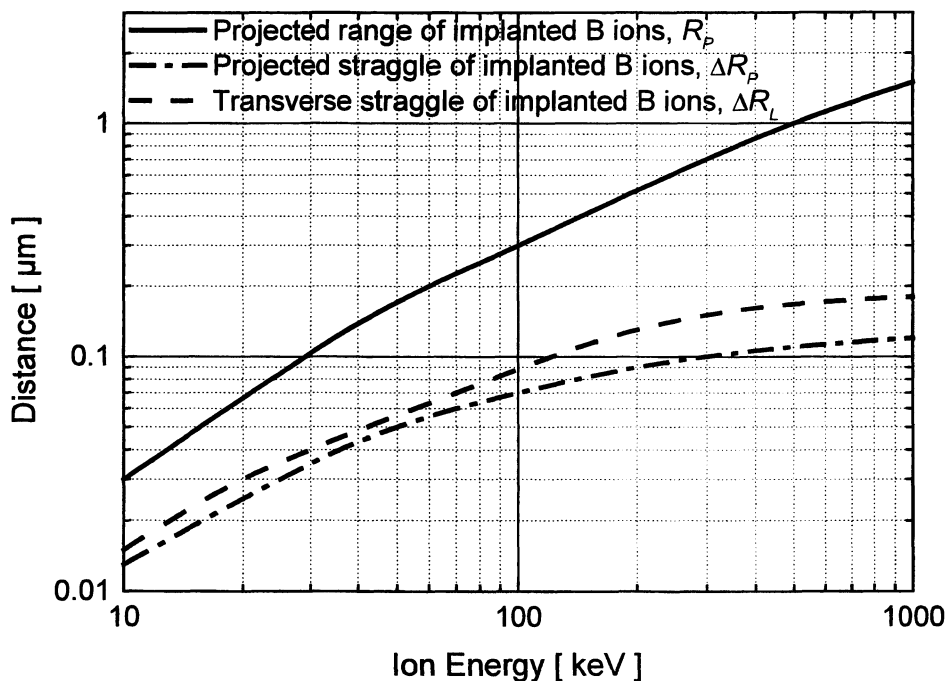

Fig. 1

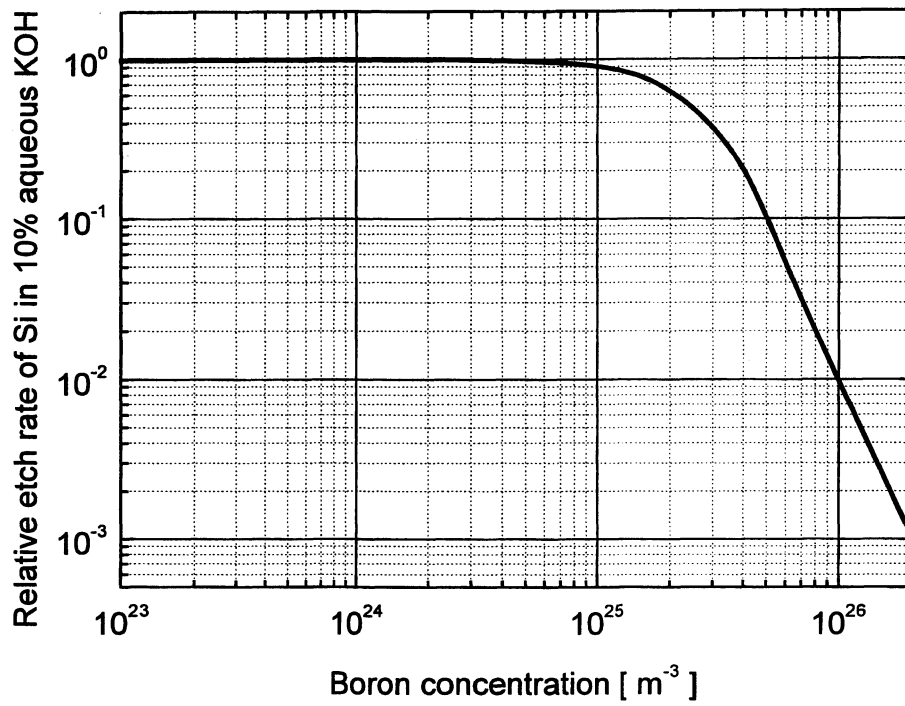

Fig. 2

Fig. 3

2 (a) Briefly describe each of the following metal coating technologies and sketch the cross section of the layer that each would produce on the conducting substrate shown in Fig. 4:

immersion plating;

[15%]

electroless plating;

[15%]

electroplating.

[15%]

(b) A microscale accelerometer is to be made from a simple cantilever beam of width w , height h and length l .

(i) Determine the *material selection metric* for fabricating a beam which produces the greatest deflection for a given acceleration applied to the beam as shown in Fig. 5. State any assumptions made.

[20%]

(ii) Using the information provided in the Materials Data Book and your knowledge of thin film processing, suggest a suitable material for producing this cantilever if it is to be 5 μm thick. Explain your reasoning.

[15%]

(iii) What is the *geometry metric* for producing the greatest cantilever deflection for the same acceleration applied to the beam as shown in Fig. 5? Discuss the practical constraints that limit the maximisation of this parameter.

[20%]

Note: The deflection δ of a cantilever beam at its unsupported end under the application of a force F distributed uniformly over the surface is

$$\delta = \frac{3Fl^3}{2Ewh^3}$$

where E is Young's modulus of the material.

Fig. 4

Fig. 5

3 (a) Describe how the BOSCH process enables deep reactive ion etching of bulk crystalline silicon at high rates. [35%]

(b) A particular deep reactive ion silicon etch removes silicon at a rate of 100 nm s^{-1} and has a selectivity of 75:1 relative to a standard positive photoresist and 150:1 relative to silicon oxide. Design a detailed process flow which uses this etch to produce an array of capillaries and associated fluid storage wells in an oxide coated, silicon-on-insulator wafer, as shown in Fig. 6. The capillaries are tubes of $10 \mu\text{m}$ diameter and $400 \mu\text{m}$ depth centred below cylindrical storage wells of $200 \mu\text{m}$ diameter and $50 \mu\text{m}$ depth. Include a calculation of the thickness of the oxide and photoresist layers required by your process. Identify the step in the process flow that is most likely to reduce yield and explain your reasoning. [65%]

Fig. 6

- 4 (a) What additional materials selection criteria must be considered in the design of a microsystem that will be used to monitor fluid pressure in a biological system compared with a similar device to be used in a non-biological environment? [30%]
- (b) A particular long chain biological molecule has a hydrophilic functional group on one end and a hydrophobic functional group at the other end.
- (i) Describe how microcontact printing and lift-off may each be used to produce a patterned monolayer of this molecule on a flat silicon oxide coated silicon substrate such that the hydrophilic end of the molecule is closest to the substrate. [35%]
- (ii) Compare the relative advantages and disadvantages of microcontact printing and lift-off for this application. [25%]
- (iii) For what type of biological sensing devices might each of these patterning processes be appropriate? [10%]

SECTION 1: MATERIAL PROPERTIES

1.1 CRYSTALLINE SILICON (C-Si)

Property	Value
Atomic weight	28.1
Atomic density	$5 \times 10^{28} \text{ m}^{-3}$
Band gap at 300 K	1.12 eV
Chemical resistance	High (resistant to most acids and some bases)
Density	2400 kg m^{-3}
Dielectric constant	11.8
Dielectric strength	$3 \times 10^8 \text{ V m}^{-1}$
Electron mobility	$0.150 \text{ m}^2 \text{ V}^{-1} \text{ s}^{-1}$
Fracture strength	6 GPa
Hole mobility	$0.040 \text{ m}^2 \text{ V}^{-1} \text{ s}^{-1}$
Intrinsic carrier concentration	$1.45 \times 10^{16} \text{ m}^{-3}$
Intrinsic resistivity	$2.3 \times 10^3 \text{ } \Omega \text{ m}$
Knoop hardness	850 kg mm^{-2}
Lattice constant	0.543 nm
Linear coefficient of thermal expansion at 300 K	$2.6 \times 10^{-6} \text{ K}^{-1}$
Melting point	1688 K
Minority carrier lifetime	$2.5 \times 10^{-3} \text{ s}$
Poisson ratio	0.22
Relative permittivity	11.8
Specific heat at 300 K	$713 \text{ J kg}^{-1} \text{ K}^{-1}$
Thermal conductivity at 300 K	$156 \text{ W m}^{-1} \text{ K}^{-1}$
Tempertaure coefficient of the Young Modulus at 300 K	$90 \times 10^{-6} \text{ K}^{-1}$
Thermal diffusivity	$0.9 \times 10^{-4} \text{ m}^2 \text{ s}^{-2}$
Yield strength	7 Gpa
Young modulus	190 GPa

1.2 HYDROGENATED AMORPHOUS SILICON (A-Si:H)

Property	Value
Activation energy of conduction at 300 K	0.7 – 0.8 eV
Chemical resistance	Fairly high (resistant to most acids and some bases)
Compressive Stress	-1 – 0.5 GPa
Dark conductivity	$10^{-9} - 10^{-8} \Omega^{-1} \text{ m}^{-1}$
Defect density	10^{22} m^{-3}
Electron mobility	$10^{-4} \text{ m}^2 \text{ V}^{-1} \text{ s}^{-1}$
Hole mobility	$2 \times 10^{-6} \text{ m}^2 \text{ V}^{-1} \text{ s}^{-1}$
Hydrogen content	5 – 15 at. %
Optical (Tauc) gap	1.75 – 1.85 eV
Photoconductivity	$10^{-3} - 10^{-3} \Omega^{-1} \text{ m}^{-1}$
Photosensitivity	10^6
Poisson ratio	0.25
Refractive index	3.5 – 3.8
Urbach energy	50 – 60 meV
Young modulus	130 – 160 GPa

1.3 POLYCRYSTALLINE DIAMOND

Property	Value
Breakdown strength	10^9 V m^{-1}
Density	3500 kg m^{-3}
Dielectric constant	5.5
Electron mobility	$0.22 \text{ m}^2 \text{ V}^{-1} \text{ s}^{-1}$
Energy gap	5.5 eV
Hole mobility	$0.16 \text{ m}^2 \text{ V}^{-1} \text{ s}^{-1}$
Knoop hardness	$10^{10} \text{ kg m}^{-2}$
Melting point	4000° C
Thermal conductivity	$2000 \text{ W m}^{-1} \text{ K}^{-1}$
Thermal expansion coefficient	$8 \times 10^{-8} \text{ K}^{-1}$
Yield strength	53 GPa
Young modulus	1035 GPa

1.4 POLYCRYSTALLINE SILICON (POLY-Si)

Property	Value
Density	2320 kg m ⁻³
Dielectric constant	4.2
Electron mobility	(3 – 60)×10 ⁻³ m ² V ⁻¹ s ⁻¹
Fracture strength	0.8 – 2.84 GPa
Poisson ratio	0.23
Refractive index	4.1
Residual stress	Compressive
Thermal conductivity	30 – 70 W m ⁻¹ K ⁻¹
Thermal expansion coefficient	2.8×10 ⁻⁶ K ⁻¹
Young modulus	160 GPa

1.5 SILICON DIOXIDE (A-SiO)

Property	Value
Band gap at 300 K	9 eV
Density	2200 kg m ⁻³
Dielectric constant	3.9
Dielectric strength	10 ⁹ V m ⁻¹
Etch rate in buffered HF	100 nm min ⁻¹
Melting point	~1600° C
Poisson ratio	0.20
Resistivity	10 ¹² – 10 ¹⁴ Ω m
Refractive index	1.46
Residual Stress	~350 MPa (Compressive)
Thermal conductivity	1.4 W m ⁻¹ K ⁻¹
Thermal expansion coefficient	0.35×10 ⁻⁶ K ⁻¹ (Thermal) 2.3×10 ⁻⁶ K ⁻¹ (PECVD)
Young modulus	70 GPa

1.6 SILICON NITRIDE (A-SiN)

Property	Value
Band gap at 300 K	5.3 eV
Density	3440 kg m ⁻³
Dielectric constant	7.5
Dielectric strength	10 ⁹ V m ⁻¹
Etch rate in concentrated HF	20 nm min ⁻¹
Etch rate in buffered HF	1 nm min ⁻¹
Hydrogen content	4 – 8 at. % (LPCVD) 20 – 25 at. % (PECVD)
Melting point	3440° C
Poisson ratio	0.27
Resistivity	10 ¹² - 10 ¹⁴ Ω m
Refractive index	2.01
Thermal conductivity	19 W m ⁻¹ K ⁻¹
Thermal expansion coefficient	1.6×10 ⁻⁶ K ⁻¹
Yield strength	6.9 Gpa
Young modulus	380 GPa

SECTION 2: COMMON FORMULAE & DATA

2.1 DOPING

For the case of an infinitely deep medium where $C \rightarrow 0$ as $x \rightarrow \infty$ and there is a constant concentration of impurities at the surface as a function of time, C_s , then the solution to the diffusion equation is

$$C(x,t) = C_s \operatorname{erfc}\left(\frac{x}{2\sqrt{Dt}}\right) \quad (2.8)$$

For ion implantation, dopants are implanted with a Gaussian distribution,

$$N_i(x) = \frac{Q_i}{\Delta R_p \sqrt{2\pi}} \exp\left[-\left(\frac{x - R_p}{4\Delta R_p}\right)^2\right] \quad (2.9)$$

2.2 THERMAL CRYSTALLISATION

For a material undergoing thermal crystallisation, the nucleation rate of crystallites is given by

$$N \propto \frac{1}{T} \exp\left[\frac{-(E_d + \Delta G_n^*)}{kT}\right] \quad (3.5)$$

Once nucleated, crystals grow with a velocity given by

$$v \propto \exp\left[\frac{-(2E_d - \Delta G')}{2kT}\right] \quad (3.6)$$

2.3 THERMAL EVAPORATION

For a material undergoing thermal evaporation, the flux of atoms evaporating per second, F , is given by

$$F = N_0 \exp\left(\frac{-\Phi_e}{kT}\right) \quad (5.1)$$

where N_0 is a slowly varying function of temperature and Φ_e is the activation energy required to evaporate one molecule which is related to the enthalpy of formation of the evaporant, H , by

$$\Phi_e = \frac{H}{N_A} \quad (5.2)$$

The deposition rate at a distance d from the source is

$$R \sim \frac{\cos \beta \cos \theta}{d^2} \quad (5.3)$$

2.4 SPUTTERING

The Sigmund expression for sputter yield is

$$S \propto \frac{eE}{Ua\{M_i/M_t\}} \quad (5.4)$$

where U is the heat of sublimation of the target material, a is a near linear function of (M_i/M_t) , M_i is the ion mass, M_t is the target atom mass, E is the ion energy and e is the momentum transfer function which for elastic collisions is given by

$$e = \frac{4M_iM_t}{(M_i + M_t)^2} \quad (5.5)$$

2.5 ELECTROPLATING

From the Faraday Law of electrolysis, the mass of metal deposited per unit area per unit time, M , is given by

$$M = \frac{JA}{zF} \quad (5.11)$$

where, assuming 100% current efficiency, J is the current density *due to metal ions*, A and z are the atomic weight and valency of the metal respectively and F is the Faraday constant, which is 96500 C.

2.6 ELASTIC MODULI

For an anisotropic *cubic* material, we may still calculate the Young modulus in an arbitrary crystallographic direction from the compliance coefficients,

$$E = \frac{1}{S_{11} - (2S_{11} - 2S_{12} - S_{44})(l_1^2l_2^2 + l_2^2l_3^2 + l_1^2l_3^2)} \quad (6.8)$$

Additionally, we may gain an estimate of the Young modulus for a polycrystalline cubic material from the compliance coefficients by averaging equation (6.8) over all directions

$$\bar{E} \approx \frac{1}{0.6S_{11} + 0.4S_{12} + 0.25S_{44}} \quad (6.9)$$

The Poisson ratio for any normal plane in an anisotropic cubic material is

$$\nu = -E \left[S_{12} + \left(S_{11} - S_{12} - \frac{S_{44}}{2} \right) (l_1^2m_1^2 + l_2^2m_2^2 + l_3^2m_3^2) \right] \quad (6.11)$$

The Shear modulus is dependent on the Young modulus and Poisson ratio

$$G = \frac{E}{2(1+\nu)} \quad (6.22)$$

The Bulk modulus is given by

$$K = \frac{E}{3(1-2\nu)} \quad (6.27)$$

2.7 PIEZOELECTRICITY

For piezoelectric materials,

$$D = d\sigma + \epsilon_0 \epsilon_r \Big|_{\sigma} E \quad (6.33a)$$

$$D = e\epsilon + \epsilon_0 \epsilon_r \Big|_{\epsilon} E \quad (6.33b)$$

and the electromechanical coupling coefficient is given by

$$k = \sqrt{\frac{de}{\epsilon_0 \epsilon_r \Big|_{\sigma}}} \quad (6.35)$$

2.8 PIEZORESISTIVITY

For piezoresistive materials, the Ohm Law becomes

$$\mathbf{E} = [\rho_e + \mathbf{\Pi} \cdot \boldsymbol{\sigma}] \cdot \mathbf{J} \quad (6.38)$$

For a cubic material, such as silicon, once again the situation is simplified. The resistivity term becomes a simple scalar. We use the same numbering system for the stress tensor, so that

$$[x, y, z, yz, zx, xy] \Leftrightarrow [1, 2, 3, 4, 5, 6] \quad (6.39)$$

The field-current relationships, given the symmetry of the cubic system, become

$$\begin{aligned} \frac{E_x}{\rho_e} &= [1 + \pi_{11}\sigma_x + \pi_{12}(\sigma_y + \sigma_z)]J_x + \pi_{44}(\tau_{xy}J_y + \tau_{xz}J_z) \\ \frac{E_y}{\rho_e} &= [1 + \pi_{11}\sigma_y + \pi_{12}(\sigma_x + \sigma_z)]J_y + \pi_{44}(\tau_{xy}J_x + \tau_{yz}J_z) \\ \frac{E_z}{\rho_e} &= [1 + \pi_{11}\sigma_z + \pi_{12}(\sigma_x + \sigma_y)]J_z + \pi_{44}(\tau_{xz}J_z + \tau_{yz}J_y) \end{aligned} \quad (6.40)$$

Where the three independent coefficients from the fourth rank piezoresistive tensor are

$$\begin{aligned} \rho_e \pi_{11} &= \Pi_{1111} \\ \rho_e \pi_{12} &= \Pi_{1122} \\ \rho_e \pi_{44} &= \Pi_{2323} \end{aligned} \quad (6.41)$$

Change in resistance due to the piezoresistivity effect is given by

$$\frac{\Delta R}{R} = \pi_l \sigma_l + \pi_t \sigma_t \quad (6.42)$$

Where σ_l and σ_t are the longitudinal and transverse stress and π_l and π_t may be determined from the piezoelectric coefficients using the transformation

$$\pi_l = \pi_{11} - 2(\pi_{11} - \pi_{12} - \pi_{44})(l_1^2 l_2^2 + l_1^2 l_3^2 + l_2^2 l_3^2) \quad (6.43a)$$

$$\pi_t = \pi_{12} + (\pi_{11} - \pi_{12} - \pi_{44})(l_1^2 t_1^2 + l_2^2 t_2^2 + l_3^2 t_3^2) \quad (6.43b)$$

2.9 MICROSCOPY

For a simple optical system comprising an objective and condenser, it can be shown that the resolving power is given by

$$\delta = \frac{C\lambda}{\eta \sin \alpha} \quad (8.2)$$

In an electron microscope, the electron wavelength is given by the de Broglie equation,

$$\lambda = h/p \quad (8.3)$$

2.10 THE STONEY EQUATION

The Stoney equation states that

$$\sigma = \frac{E}{6(1-\nu)} \frac{t_s^2}{t} \left(\frac{1}{R_c} - \frac{1}{R_0} \right) \quad (8.7)$$

2.11 X-RAY DIFFRACTION

The Bragg equation for diffraction states that constructive interference will only occur when

$$n\lambda = 2d \sin \theta \quad (8.8)$$

For a given set of planes ($h k l$) in a cubic unit cell with side lengths a , b and c , the plane separation in equation 8.8 will be given by

$$\frac{1}{d^2} = \frac{h^2}{a^2} + \frac{k^2}{b^2} + \frac{l^2}{c^2} \quad (8.9)$$

The structure factor, F_{hkl} , the modulus of which gives the amplitude of the wave diffracted by a particular set of planes, and is given by

$$|F_{hkl}| = \sum_1^N f_n \exp[2\pi j(hu_n + kv_n + lw_n)] \quad (8.10)$$

Table 4.1 Diffraction peaks observed and not present in some common bravais lattices.

Bravais lattice	Diffraction present	Diffraction absent
Simple	All	None
Base centred	h and k not mixed	h and k mixed
Body centred	$(h + k + l)$ even	$(h + k + l)$ odd
Face centred	h , k and l not mixed	h , k and l mixed

2.12 UV-VISIBLE SPECTROMETRY

The absorption coefficient, α , of a material may be determined as a function of photon energy,

$$\%T = (100 - \%R) \exp(-\alpha t)$$

$$\alpha = \frac{-1}{t} \ln \left(\frac{\%T}{100 - \%R} \right) \quad (8.13)$$

2.13 FOURIER TRANSFORM INFRARED SPECTROMETRY

The size of the absorption peaks provide a rough guide to elemental composition (± 1 at. %),

$$C = -K_A \int \frac{\ln(\%T/100)}{kt} dk \quad (8.14)$$

Wavenumber (cm^{-1})	Bond	Vibrational mode type
460	Si—O _s	Rock

3350	N—H	Stretch

2.14 PHOTOLITHOGRAPHY

The empirical expression for photoresist thickness is

$$t = \frac{KC^\beta \eta^\gamma}{R^\alpha} \quad (9.2)$$

where C is the polymer concentration in g per 100 ml, h is the intrinsic viscosity, R is the number of rotations per minute, K is a calibration constant and α , β and γ are resist-dependent constants.

For positive resists, contrast is given by

$$\gamma = \frac{1}{(\log D_p - \log D_p^0)} = \left[\log \frac{D_p^0}{D_p} \right]^{-1} \quad (9.3)$$

whilst for negative resists

$$\gamma = \frac{1}{(\log D_g^0 - \log D_g^i)} = \left[\log \frac{D_g^0}{D_g^i} \right]^{-1} \quad (9.4)$$

The resolution for shadow printing using a conventional resist of thickness z and with a print gap between the mask and the resist surface of s is given by

$$R = \frac{3}{2} \sqrt{\lambda \left(s + \frac{z}{2} \right)} \quad (9.5)$$

whilst for a projection printing system,

$$R = \frac{k_1 \lambda}{N} \quad (9.6)$$

where

$$N = n \sin \theta_{\max} = \frac{D}{2F} \quad (9.7)$$

2.15 ETCHING

Etch Rates for Micromachining and IC Processing (Å/min) v.4.4 29 July 1996																	
U.C. Berkeley Microfabrication Laboratory / Berkeley Sensor & Actuator Center / Kirt R. Williams																	
The top etch rate was measured by the author with fresh solutions, clean chambers, etc.																	
The center and bottom values are the low and high etch rates observed by the author and others in the UCB Mikrolab using fresh and used solutions, clean and "dirty" chambers, etc.

Notation: - etch not performed; W=not performed, but known to work (≥ 100 Å/min); F=not performed, but known to be Fast (≥ 10 kÅ/min);
 Presence of film Packed during etch or when rinsed; A=film was visibly Attached and roughened.
 Rates measured are rounded to two significant figures.
 Each area is all of a 4-inch wafer for the transparent films and half of the wafer for single-crystal silicon and the metals.
 Each rate will vary with temperature and prior use of solution or plasma chamber, area of exposure of film, other materials present (e.g., photoresist), film impurities and microstructure, etc. Some variation should be expected.
