

EGT3  
ENGINEERING TRIPoS PART IIB

---

Wednesday 1 May 2019 2 to 3.40

---

**Module 4A3**

**TURBOMACHINERY I**

*Answer not more than two questions.*

*All questions carry the same number of marks.*

*The approximate percentage of marks allocated to each part of a question is indicated in the right margin.*

*Write your candidate number **not** your name on the cover sheet.*

**STATIONERY REQUIREMENTS**

Single-sided script paper

**SPECIAL REQUIREMENTS TO BE SUPPLIED FOR THIS EXAM**

CUED approved calculator allowed

Attachment: Excerpt from Compressible Flow Data Book (pages 1-16 of 38 pages)  
Engineering Data Book

**10 minutes reading time is allowed for this paper at the start of the exam.**

**You may not start to read the questions printed on the subsequent pages of this question paper until instructed to do so.**

- 1 (a) Using the usual definitions of stage loading coefficient,  $\psi$ , and compressor polytropic efficiency,  $\eta_{pc}$ , show that the stage stagnation pressure ratio,  $p_{03}/p_{01}$ , can be written as

$$\frac{p_{03}}{p_{01}} = \left[ \frac{\psi U^2}{c_p T_{01}} + 1 \right]^{\frac{\gamma \eta_{pc}}{\gamma - 1}}$$

where  $U$  is the blade speed,  $T_{01}$  is the inlet stagnation temperature,  $\gamma$  is the ratio of specific heats and  $c_p$  is the specific heat capacity at constant pressure. [10%]

- (b) Considering the expression given in part (a), comment on the different ways to achieve a high stage stagnation pressure ratio. Comment on the related issues and how they can be mitigated. [10%]

- (c) An overall stagnation pressure ratio of 1.45 is required from an air compressor. For a stage loading of  $\psi = 0.35$ , determine the number of stages required to achieve this pressure ratio using:

- (i) a subsonic style compressor with blade speed 60% of the stagnation sound speed at inlet and polytropic efficiency of  $\eta_{pc} = 0.9$ ; [10%]
- (ii) a transonic compressor with blade speed 110% of the stagnation sound speed at inlet, but a lower polytropic efficiency of  $\eta_{pc} = 0.85$ . [10%]

- (d) A single stage air compressor has zero inlet swirl and a constant mean radius of 0.567 m. At design conditions (i.e. zero incidence) an inlet Mach number of 0.6 corresponds to an inlet absolute stagnation temperature of 300 K and rotational speed of 6000 rpm. The rotor blades are thin, with negligible camber. At these conditions, the rotor blade has a normal shock within the passage.

- (i) Show that the design rotor relative inlet Mach number is 1.22. [20%]
- (ii) Calculate the inlet flow coefficient, absolute flow angle at rotor outlet (neglecting deviation) and the stage loading coefficient. Draw the rotor velocity triangles. [20%]
- (iii) Neglecting viscous effects, estimate the stagnation pressure loss coefficient of the rotor. [20%]

Assume air behaves as a perfect gas  $\gamma = 1.4$  and  $c_p = 1005 \text{ J kg}^{-1} \text{ K}^{-1}$ .

2 A single stage turbine is tested in air at design conditions which correspond to an inlet stagnation pressure of 8 bar, inlet total temperature 450 K, rotational speed 8000 rpm and mass flow rate  $30 \text{ kg s}^{-1}$ . The mean radius is 0.3 m. The stage loading coefficient at design conditions is 1.2 and the isentropic efficiency is 0.85. You should assume that the blade span is much less than the mean radius. The axial velocity is constant through the stage and the annulus height is constant between the NGV throat and rotor inlet.

(a) The NGV exit Mach number is 0.95, the opening-to-pitch ratio of  $o/s = 0.31$  and the stagnation pressure loss coefficient of  $Y_p = (p_{01} - p_{02})/(p_{01} - p_2) = 0.03$ .

(i) Assuming that all loss occurs downstream of the choked throat, show that the NGV exit flow angle is  $71.65^\circ$  and the flow coefficient is  $\phi = V_x/U = 0.466$ . What is the error in flow coefficient if the flow is assumed to be isentropic to the same exit Mach number? [25%]

(ii) Calculate the blade span at rotor inlet. [20%]

(iii) Calculate the absolute and relative flow angle at rotor exit, the power output and stage stagnation pressure ratio. Draw the velocity triangles. [25%]

(b) A fault occurs at the test facility such that the inlet temperature is increased to 550 K whilst the inlet stagnation pressure remains the same.

(i) Determine the new mass flow rate if the NGV is still choked. [10%]

(ii) Assuming that the NGV exit Mach number and loss coefficient are unaffected, determine the new rotational speed needed to maintain the relative inlet flow angle at rotor inlet? [20%]

Assume air behaves as a perfect gas with ratio of specific heats  $\gamma = 1.4$  and specific heat capacity at constant pressure  $c_p = 1005 \text{ J kg}^{-1} \text{ K}^{-1}$ .

- 3 (a) Describe what is meant by a *rotating stall cell* in a single stage axial flow compressor and the physical processes that cause the cell to rotate. [15%]
- (b) Explain the differences between stall cells that are most likely to occur in low hub-to-tip ratio axial compressors and those of high hub-to-tip ratio. [15%]
- (c) Show that for a single stage of a multi-stage compressor

$$\frac{p_{02}}{p_{01}} = \left[ 1 + \eta_{is} (\gamma - 1) M_b^2 \frac{\Delta h_0}{U^2} \right]^{\frac{\gamma}{\gamma-1}}$$

where  $p_{01}$  and  $p_{02}$  are the stagnation pressures at stage inlet and outlet respectively,  $\eta_{is}$  is the stage isentropic efficiency,  $M_b$  is the rotor blade Mach number (based on stagnation sound speed),  $\Delta h_0$  is the stage stagnation enthalpy rise and  $U$  is the blade speed. Show that, for values typical of current technology,

$$\frac{\Delta p_0}{\rho_0 U^2} \approx \eta_{is} \frac{\Delta h_0}{U^2}$$

and hence explain why stage characteristics for compressors are usually plotted using incompressible variables. [30%]

- (d) The overall characteristic of a five-stage axial compressor is shown in Fig. 1 with four operating points,  $a$ ,  $b$ ,  $c$  and  $d$  marked. On a sketch of the stage characteristics for the first and last stages, mark the likely equivalent stage operating points corresponding to  $a$ ,  $b$ ,  $c$  and  $d$ . Explain briefly the reasons for your choices. [25%]
- (e) Describe the likely form of stall and which stages are primarily responsible for instability at 60%, 80% and 100% compressor speeds. [15%]

# Compressible Flow

## Data Book

for Part II of the  
Engineering Tripos

**2009 Edition**

Cambridge University Engineering Department

# PERFECT GAS RELATIONS FOR COMPRESSIBLE FLOW

**Ratios of stagnation to static quantities**

$$\frac{T}{T_0} = \left(1 + \frac{\gamma - 1}{2} M^2\right)^{-1}$$

$$\frac{p}{p_0} = \left(1 + \frac{\gamma - 1}{2} M^2\right)^{-\frac{\gamma}{\gamma-1}}$$

$$\frac{\rho}{\rho_0} = \left(1 + \frac{\gamma - 1}{2} M^2\right)^{-\frac{1}{\gamma-1}}$$

*Notes:*

- (1)  $T_0 = \text{const.}$  in adiabatic flow with no shaft work
- (2) If flow is isentropic,  $p_0 = \text{const.}$  and  $\rho_0 = \text{const.}$  when  $T_0 = \text{const.}$

**Mach number relations (see tables)**

$$\frac{V}{\sqrt{c_p T_0}} = \sqrt{\gamma - 1} M \left(1 + \frac{\gamma - 1}{2} M^2\right)^{-\frac{1}{2}}$$

$$\frac{\dot{m} \sqrt{c_p T_0}}{A p_0} = \frac{\gamma}{\sqrt{\gamma - 1}} M \left(1 + \frac{\gamma - 1}{2} M^2\right)^{-\frac{1}{2} \left(\frac{\gamma + 1}{\gamma - 1}\right)}$$

$$\frac{\dot{m} \sqrt{c_p T_0}}{A p} = \frac{\gamma}{\sqrt{\gamma - 1}} M \left(1 + \frac{\gamma - 1}{2} M^2\right)^{\frac{1}{2}}$$

$$\frac{F}{\dot{m} \sqrt{c_p T_0}} = \frac{\sqrt{\gamma - 1}}{\gamma} \frac{1 + \gamma M^2}{M} \left(1 + \frac{\gamma - 1}{2} M^2\right)^{-\frac{1}{2}} \quad \text{where} \quad F = (p + \rho V^2) A$$

$$\frac{\frac{1}{2} \rho V^2}{p_0} = \frac{1}{2} \gamma M^2 \left(1 + \frac{\gamma - 1}{2} M^2\right)^{-\frac{\gamma}{\gamma-1}}$$

# ONE-DIMENSIONAL FLOW OF A PERFECT GAS

**Isentropic flow**

$$\frac{A}{A^*} = \frac{1}{M} \left\{ \frac{2}{\gamma+1} \left( 1 + \frac{\gamma-1}{2} M^2 \right) \right\}^{\frac{1}{2} \left( \frac{\gamma+1}{\gamma-1} \right)}$$

**Adiabatic constant area flow**

$$\frac{4c_f L_{\max}}{D} = \frac{1-M^2}{\gamma M^2} + \frac{\gamma+1}{2\gamma} \ln \left( \frac{(\gamma+1)M^2}{2 \left( 1 + \frac{\gamma-1}{2} M^2 \right)} \right)$$

**Normal shock waves in perfect gases**

$$VV_s = a^*{}^2$$

$$M_s = \left( \frac{1 + \frac{\gamma-1}{2} M^2}{\gamma M^2 - \frac{\gamma-1}{2}} \right)^{\frac{1}{2}}$$

$$\frac{p_{0s}}{p_0} = \left( \frac{\frac{\gamma+1}{2} M^2}{1 + \frac{\gamma-1}{2} M^2} \right)^{\frac{\gamma}{\gamma-1}} \left( \frac{2\gamma}{\gamma+1} M^2 - \frac{\gamma-1}{\gamma+1} \right)^{\frac{1}{1-\gamma}}$$

$$\frac{p_s}{p} = 1 + \frac{2\gamma}{\gamma+1} \left( M^2 - 1 \right)$$

$$\frac{p_{0s}}{p} = \left( \frac{\gamma+1}{2} M^2 \right)^{\frac{\gamma}{\gamma-1}} \left( \frac{2\gamma}{\gamma+1} M^2 - \frac{\gamma-1}{\gamma+1} \right)^{\frac{1}{1-\gamma}}$$

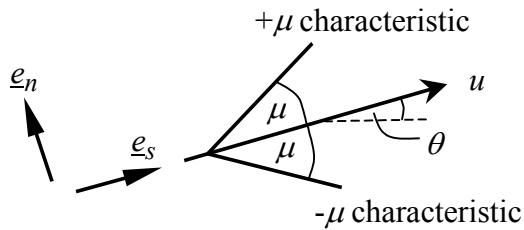

$$\frac{T_s}{T} = \frac{\gamma-1}{(\gamma+1)^2} \frac{2}{M^2} \left( 1 + \frac{\gamma-1}{2} M^2 \right) \left( \frac{2\gamma}{\gamma-1} M^2 - 1 \right)$$

$$\frac{\rho_s}{\rho} = \frac{(\gamma+1)M^2}{2 \left( 1 + \frac{\gamma-1}{2} M^2 \right)}$$

# TWO DIMENSIONAL SUPERSONIC FLOW

## Method of Characteristics for 2-D supersonic flow

**Applicable to adiabatic ( $h_0 = \text{constant}$ ), isentropic flow**

**Mach Number**

$$M = u/c$$

**Mach angle**

$$\mu = \sin^{-1}\left(\frac{1}{M}\right)$$

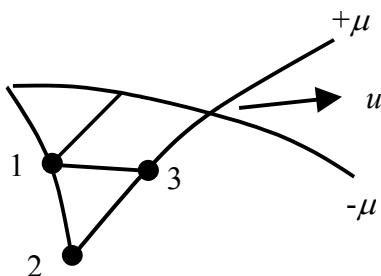

**Prandtl-Meyer function**

$$\nu = \int_1^M \sqrt{M^2 - 1} \frac{du}{u}$$

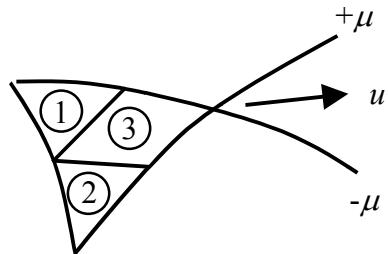

$$\nu = \sqrt{\frac{\gamma+1}{\gamma-1}} \tan^{-1} \sqrt{\frac{\gamma-1}{\gamma+1} (M^2 - 1)} - \tan^{-1} \sqrt{M^2 - 1} \quad \text{for a perfect gas}$$

## Calculations

Lattice Method

Field (or wave) method

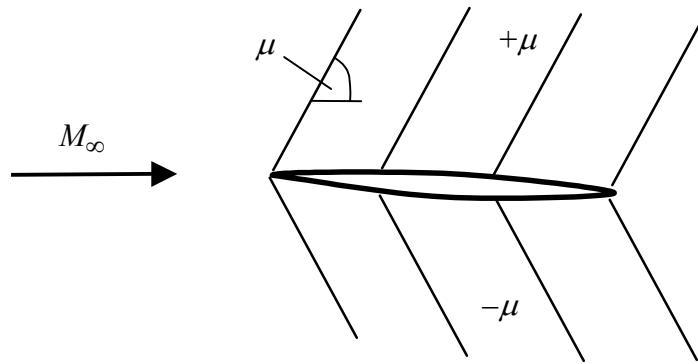

$$\nu_3 - \theta_3 = \nu_2 - \theta_2 \quad \text{along } +\mu$$

$$\nu_3 + \theta_3 = \nu_1 + \theta_1 \quad \text{across } +\mu$$

$$\nu_3 + \theta_3 = \nu_1 + \theta_1 \quad \text{along } -\mu$$

$$\nu_3 - \theta_3 = \nu_2 - \theta_2 \quad \text{across } -\mu$$

### Linearised Method of Characteristics (thin film theory)

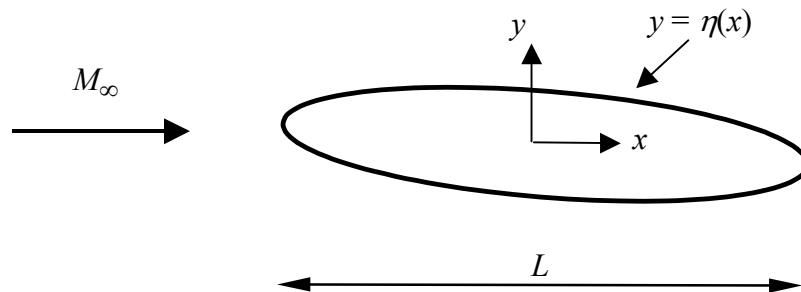

$$\mu \approx \sin^{-1}(1/M_\infty)$$

$$\Delta p \approx \pm \frac{\rho_\infty u_\infty^2 \Delta \theta}{\sqrt{M_\infty^2 - 1}} \quad \text{across } \pm \mu \text{ waves}$$

$$\text{Pressure coefficient } c_p = \frac{p - p_\infty}{\frac{1}{2} \rho_\infty u_\infty^2} = \pm \frac{2\theta}{\sqrt{M_\infty^2 - 1}} \quad \text{on upper/lower surface}$$

**Prandtl-Glauert rule for linearised potential flow past geometrically similar bodies**

$$\text{Pressure coefficient } c_p = \frac{p - p_\infty}{\frac{1}{2} \rho_\infty u_\infty^2}$$

For geometrically similar bodies with  $\frac{\eta}{L} = f\left(\frac{x}{L}\right)$  and  $c_p(M_\infty = 0) = c_{p0}$ ,

$$c_p = \frac{c_{p0}}{\sqrt{1 - M_\infty^2}} \quad \text{in subsonic flow}$$

$$c_p \propto \frac{1}{\sqrt{M_\infty^2 - 1}} \quad \text{in supersonic flow}$$

## Oblique Shock Relations (see tables)

$$\frac{p_2}{p_1} = 1 + \frac{2\gamma}{\gamma+1} \left( M_1^2 \sin^2 \beta - 1 \right)$$

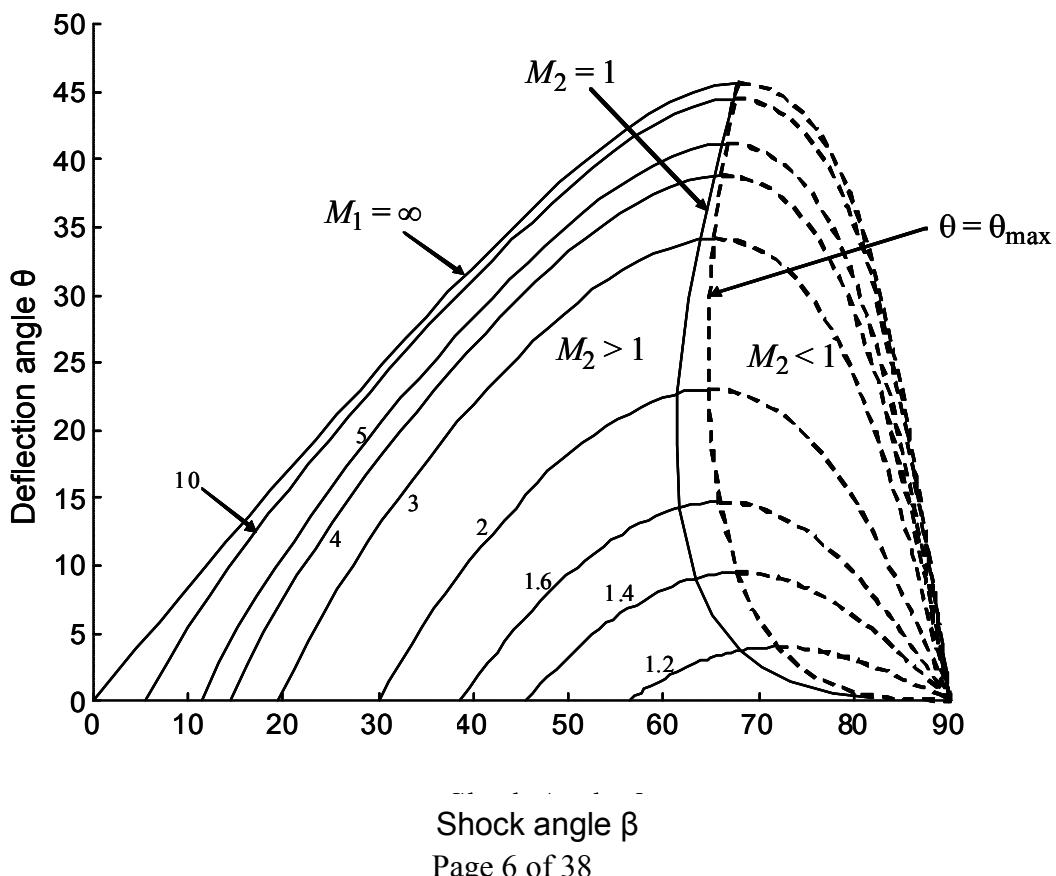

$$\frac{T_2}{T_1} = \frac{\gamma-1}{(\gamma+1)^2} \frac{2}{M_1^2 \sin^2 \beta} \left( 1 + \frac{\gamma-1}{2} M_1^2 \sin^2 \beta \right) \left( \frac{2\gamma}{\gamma-1} M_1^2 \sin^2 \beta - 1 \right)$$

$$\frac{\rho_2}{\rho_1} = \frac{(\gamma+1)M_1^2 \sin^2 \beta}{2 \left[ 1 + \frac{\gamma-1}{2} M_1^2 \sin^2 \beta \right]}$$

$$M_2 \sin(\beta - \theta) = \left[ \frac{1 + \frac{\gamma-1}{2} M_1^2 \sin^2 \beta}{\gamma M_1^2 \sin^2 \beta - \frac{\gamma-1}{2}} \right]^{\frac{1}{2}}$$

$$\frac{p_{02}}{p_{01}} = \left( \frac{\frac{\gamma+1}{2} M_1^2 \sin^2 \beta}{1 + \frac{\gamma-1}{2} M_1^2 \sin^2 \beta} \right)^{\frac{\gamma}{\gamma-1}} \left( \frac{2\gamma}{\gamma+1} M_1^2 \sin^2 \beta - \frac{\gamma-1}{\gamma+1} \right)^{\frac{1}{1-\gamma}}$$

$$\tan \theta = \frac{2 \cot \beta (M_1^2 \sin^2 \beta - 1)}{(\gamma+1)M_1^2 - 2(M_1^2 \sin^2 \beta - 1)}$$
